Shape Analogies

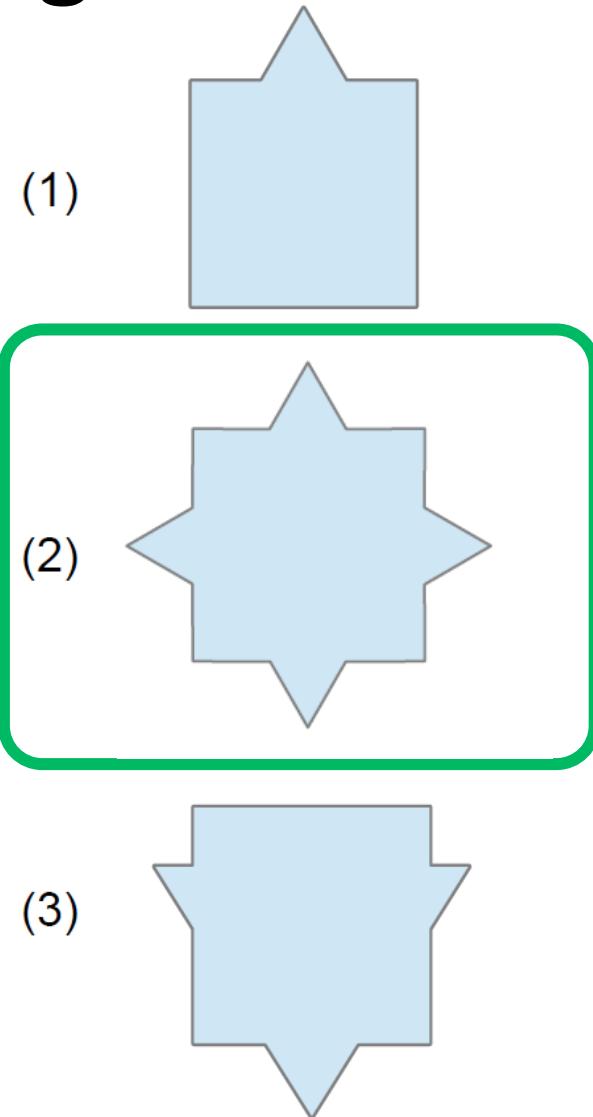

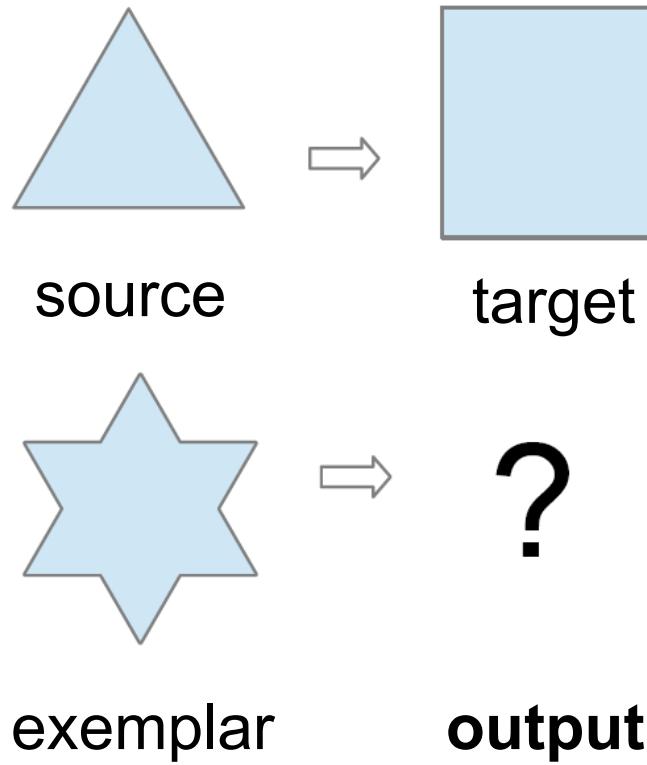

source target

exemplar output

- 
- (1) A light blue square with a small triangular peak at the top center.
- (2) A light blue four-pointed star with inward-pointing sides.
- (3) A light blue square with inward-pointing sides at all four corners.

Shape Analysis

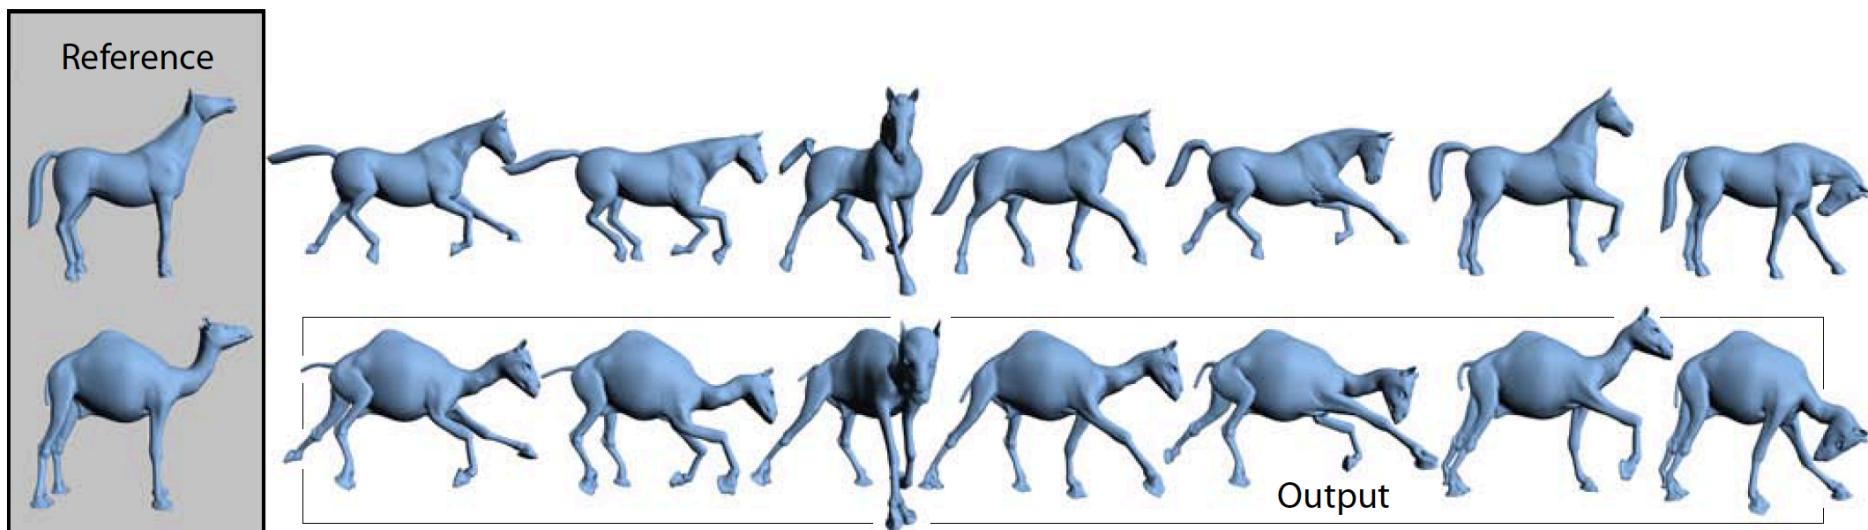

- Symmetry detection
 - [TW05, MGP06, PMW*08, MBB10]
- Full/partial mapping
 - [SAPH04, vKZHCO11, KLM*12, HZG*12, SNB*12]
- Shape analogies for retrieval
 - [ROA*13]

Part-based Shape Synthesis

- User-assisted assembly
 - [FKS*04, CKGK11]
- Randomized from shape grammars
 - [BWS10, TYK*12]
- Automatic from pre-segmented database
 - [KCKK12, XZCOC12, SFCH12]

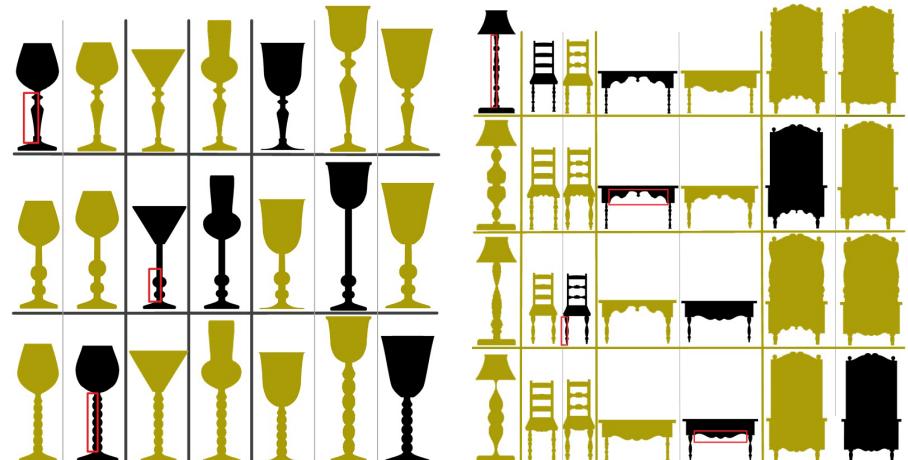

Deformation/Style Transfer

- Deformation Transfer
 - [SP04]
 - Continuous mapping, no structural difference

Deformation/Style Transfer

- Deformation Transfer
 - [SP04]
 - Continuous mapping, no structural difference
- 2D Style Transfer
 - [HJO*01, HOCS02, FTP03, LZW*13]
 - Not applicable to 3D

Deformation/Style Transfer

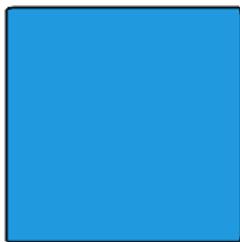

- Deformation Transfer
 - [SP04]
 - Continuous mapping, no structural difference
- 2D Style Transfer
 - [HJO*01, HOCS02, FTP03]
 - Not applicable to 3D
- 3D Part-Scale Transfer
 - [XLZ*10]
 - Require pre-segmentation and one-to-one mapping

Pre-Processing

- Consistently scale and align input models
 - Bounding boxes
 - Upright orientation
- Uniformly sample model surface
 - Point sample set $\{s\}$
 - Sample position $\mathbf{p}(s)$ and normal $\mathbf{n}(s)$

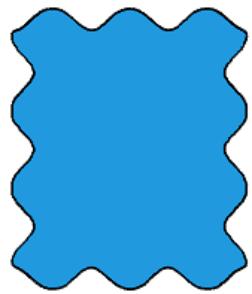

Algorithm Overview

Correspondence**

Algorithm Overview

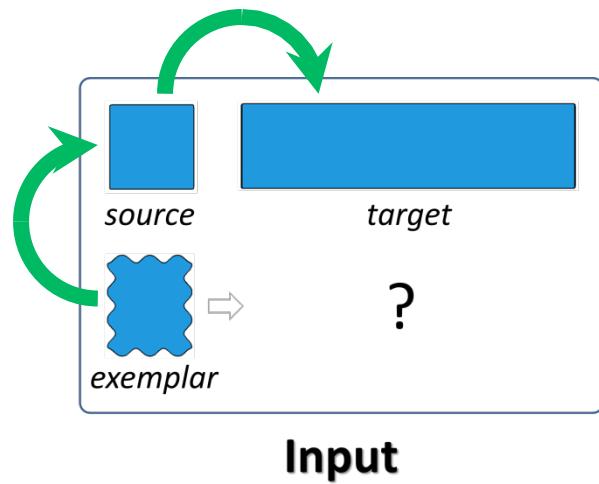

Input

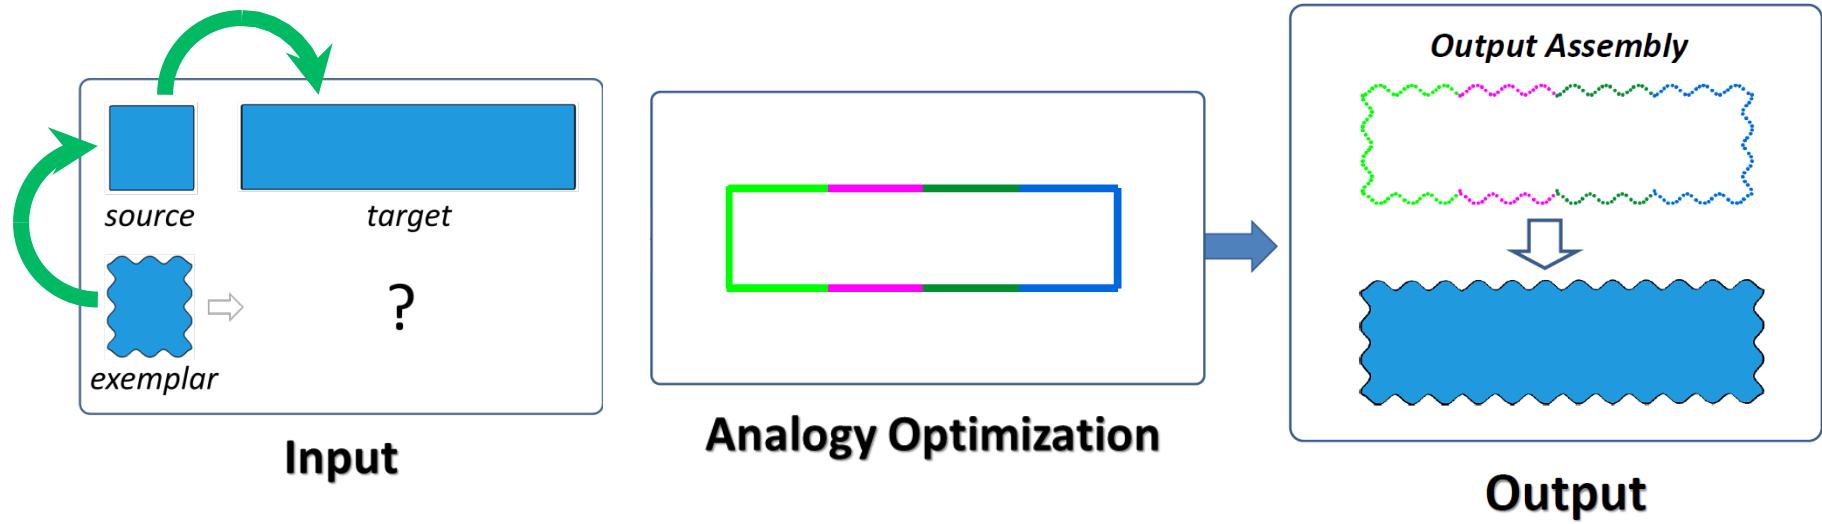

Source-Target Possible Transformations

Algorithm Overview

Analogy Optimization

Algorithm Overview

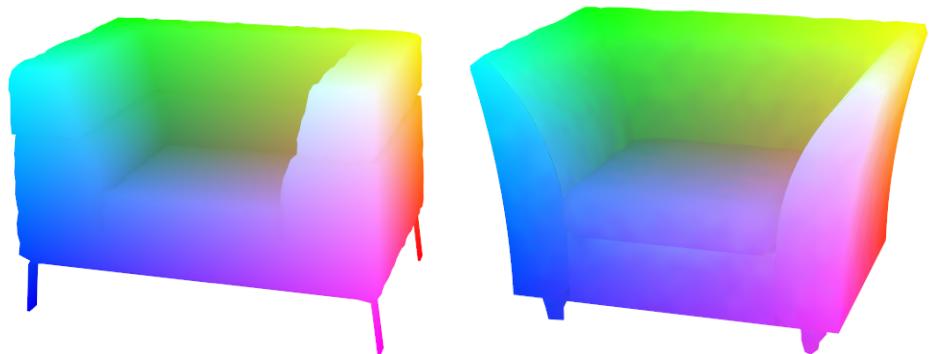

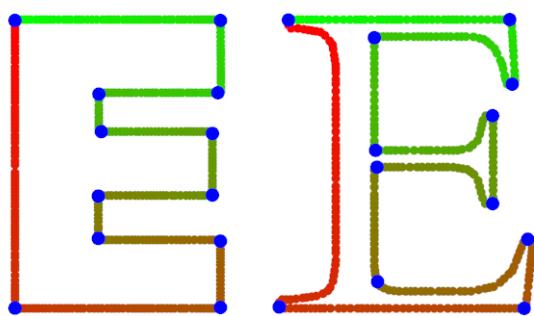

Source-Exemplar Correspondence

- Pair-wise sample distance

$$d(s_e, s_s) = \|\hat{\mathbf{p}}(s_s) - \hat{\mathbf{p}}(s_e)\|^2 + \lambda \cdot \cos^{-1}(\mathbf{n}(s_s) \cdot \mathbf{n}(s_e))$$

- Minimize sum of pair-wise distance
 - Hungarian algorithm [Kuh55]

Transformation Selection

- Initial candidate set
 - Votes from all pairs of source and target samples
 - Best align local coordinate systems
- Selected transformations $\{Q\}$ [MGP06]
 - Dominant modes from mean-shift clustering
 - Associated subsets of target samples $\{s_t\}$

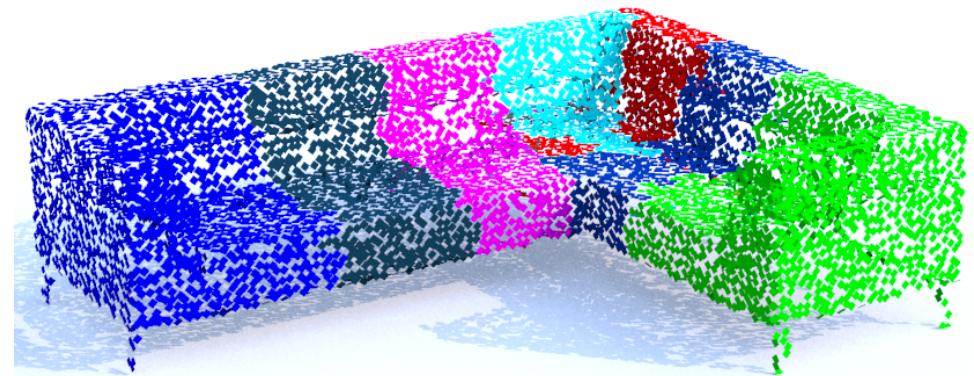

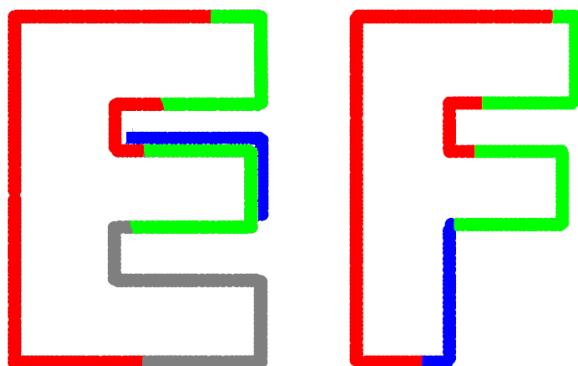

$$|Q(\mathbf{p}(s_t)) - \mathbf{p}(s_s)| < \delta_p, \quad Q(\mathbf{n}(s_t)) \cdot \mathbf{n}(s_s) > \delta_n$$

Analogy Optimization

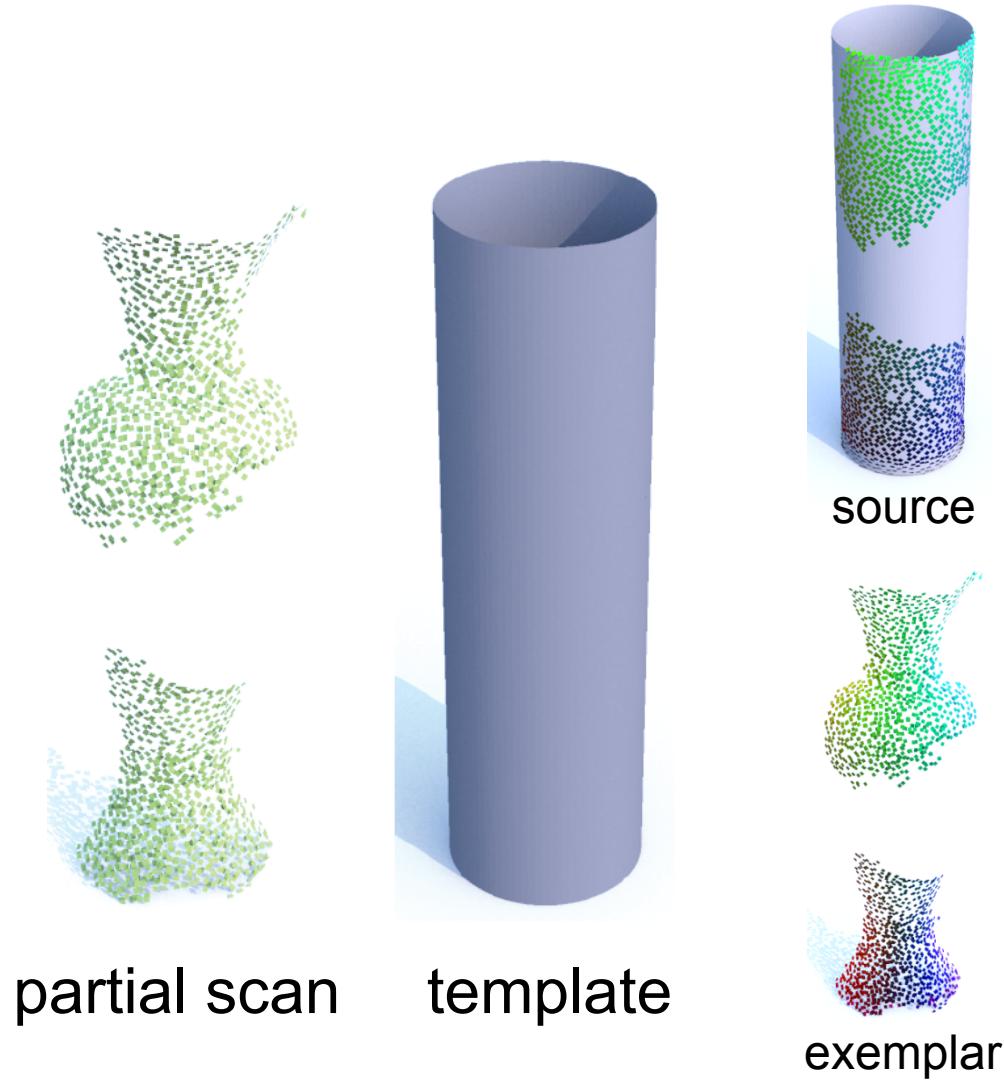

- Source-to-target analogy
 - A subset of selected transformation
 - Each target sample associated to one transformation
- Multi-label energy optimization
 - Simplicity: unary term
 - Compactness: pairwise term
 - Continuity: regularization term

Analogy Optimization

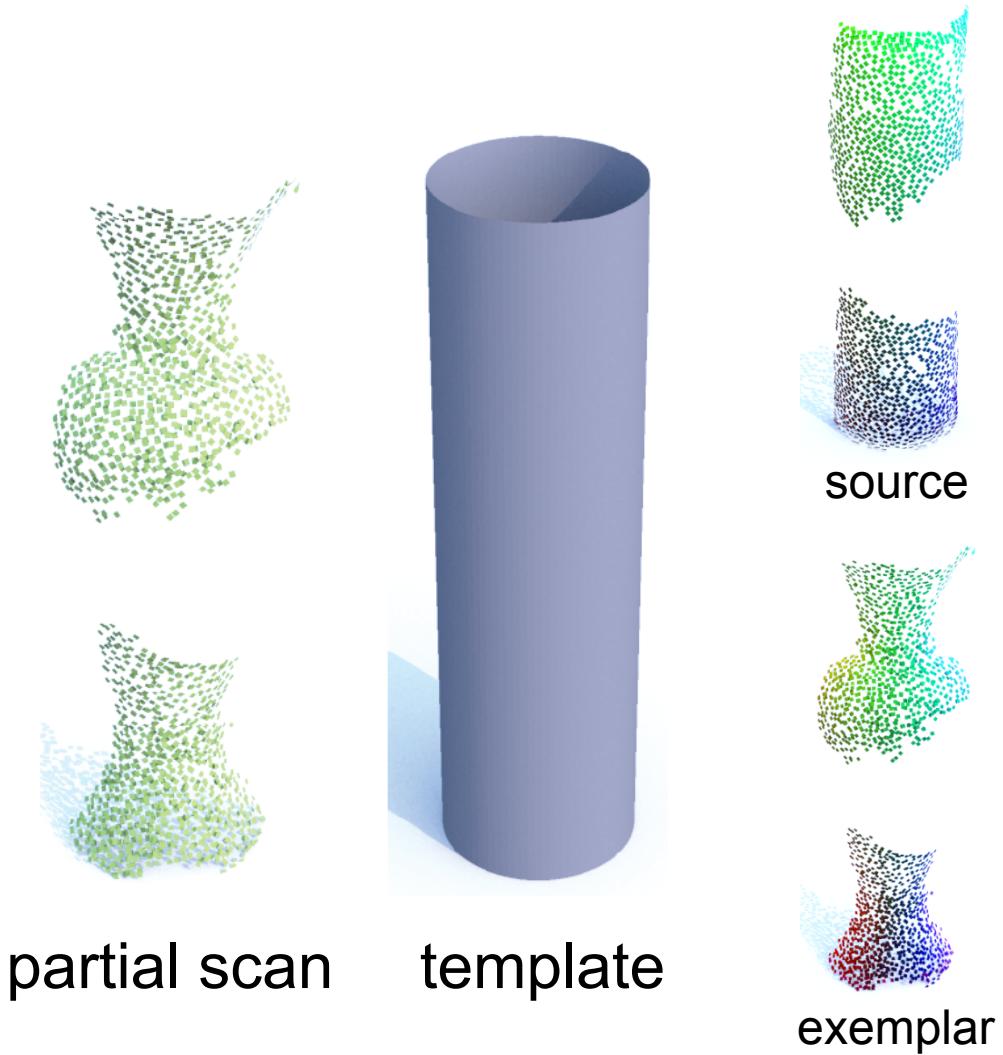

- Source-to-target analogy
 - A subset of selected transformation
 - Each target sample associated to one transformation
- Multi-label energy optimization

[KS05]

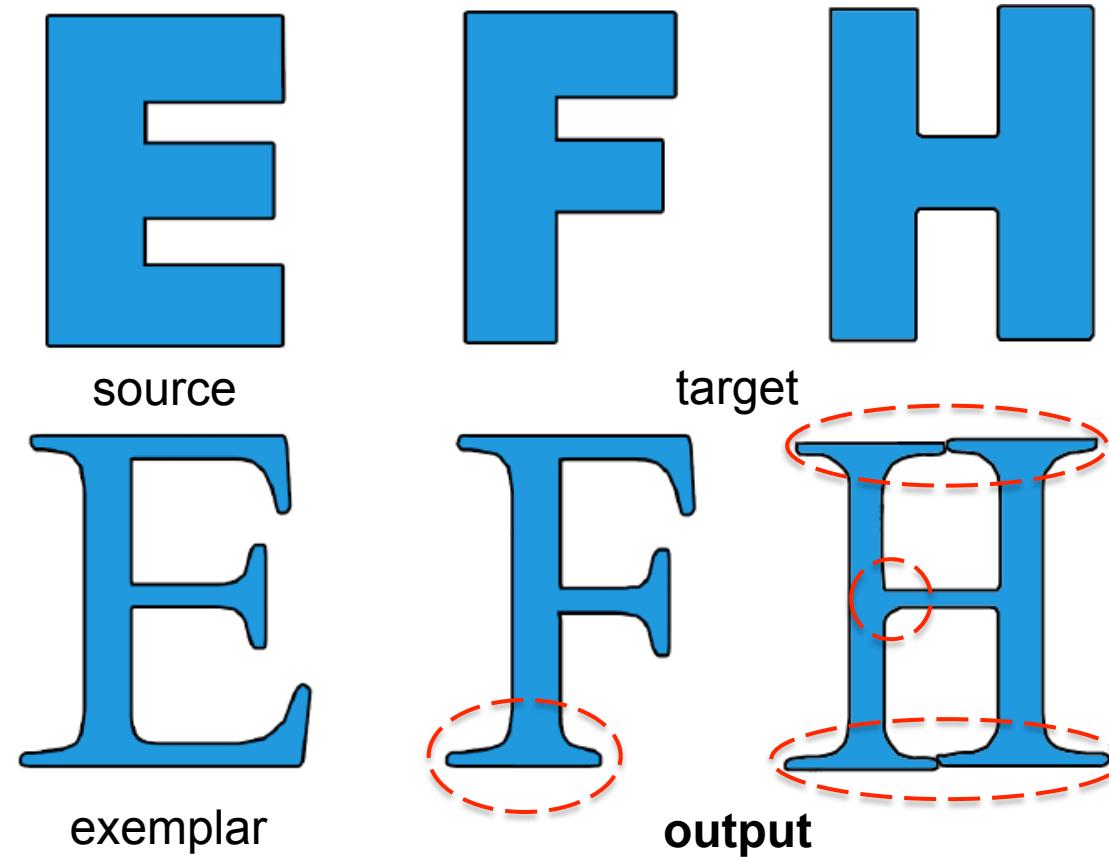

our result

Conclusion

- A analogy-driven shape synthesis framework
 - Automatically transfer diverse style characteristics between 3D shapes
- A multi-label optimization algorithm
 - Assemble simple, compact and continuous shape analogies

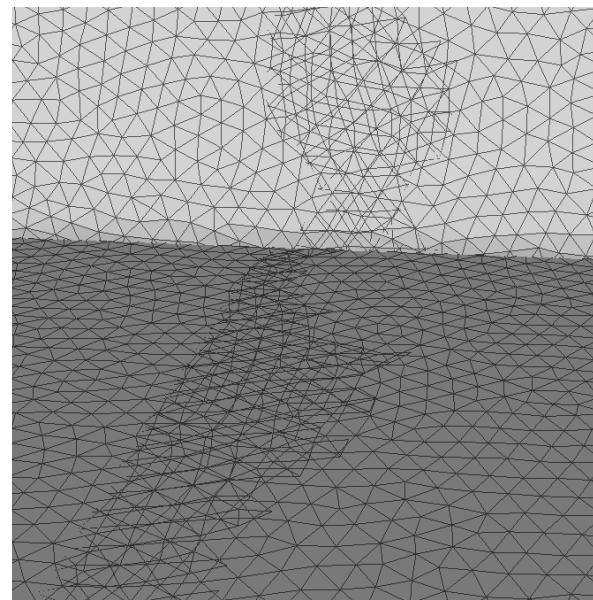

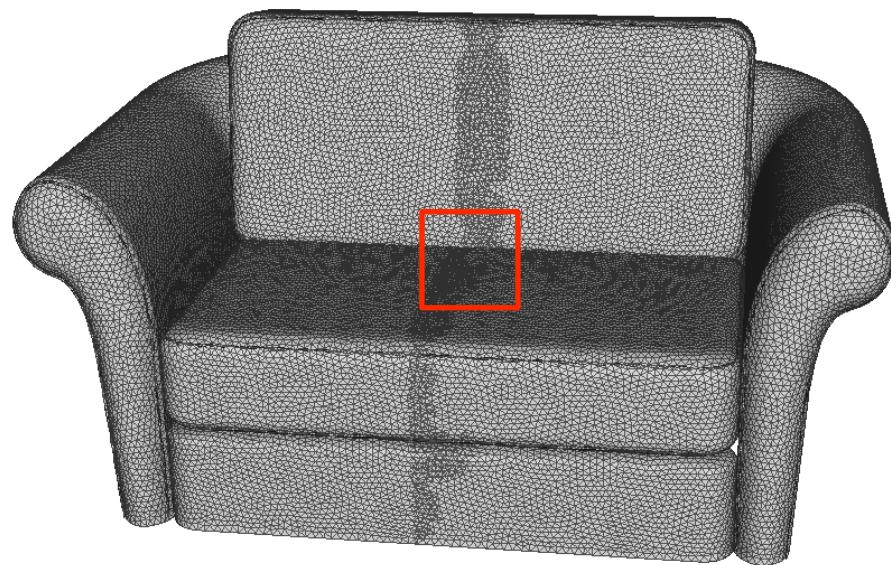

Limitations

- Symmetry between source and target only
 - No constraints for self-symmetric target

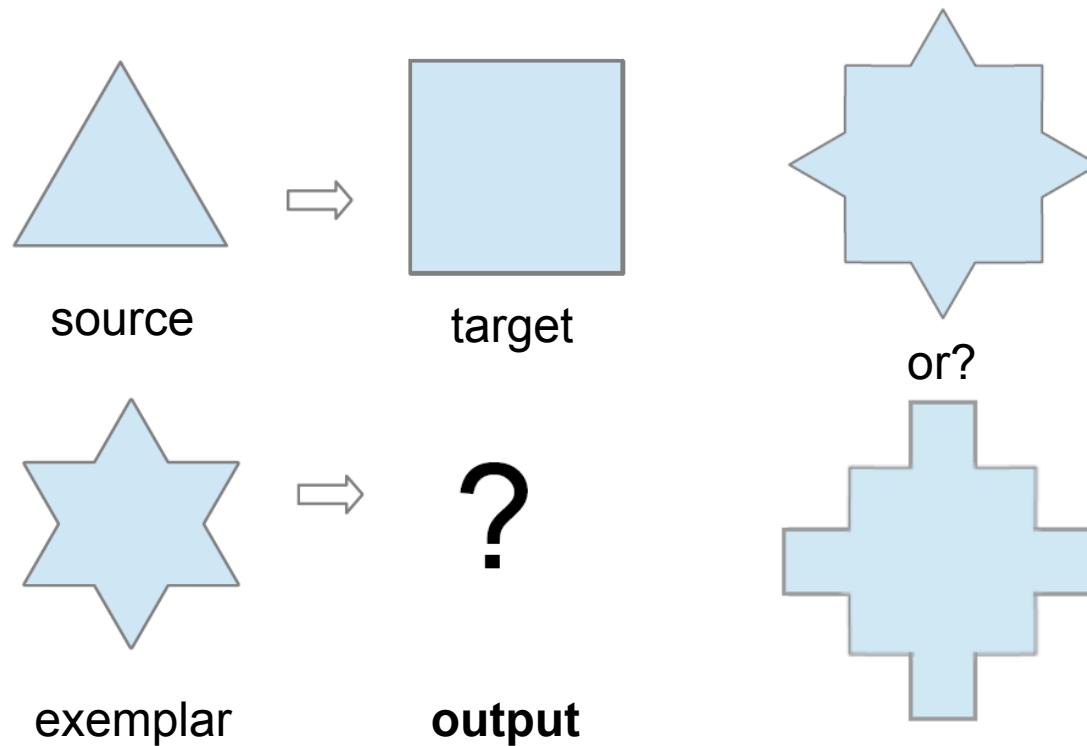

Limitations

- Overlapping mesh patches
 - No stitching

Limitations

- One reasonable solution only
 - Ambiguity

Future work

- Free-form deformation
 - Organic shapes
- Automatic input alignment
 - Shape matching and analysis tools
- Infer a source shape
 - Given only the target and exemplar
